ARABLE PROTOCOL

The first synthetic farming protocol

The Problem

- Yield farmers use assets on different chains in order to gain higher returns and alter their farming portfolios
- Several problems arise from using assets on different chains

Time for switching the chain

Security

Gas fees and slippages

Inconvenience in asset management

Chain specific knowledge

The Solution

- The Arable protocol brings multichain farms onto a single chain as well as assets

- Arable protocol allows users a frictionless staking and liquidity mining experience on users' experienced chain

Market Validation

Yield Farmers' vocal Pain-points:

- Yield Farmers did not like setting up new wallets for other farms
- Many yield farmers are unable to reach great projects on their experienced chain

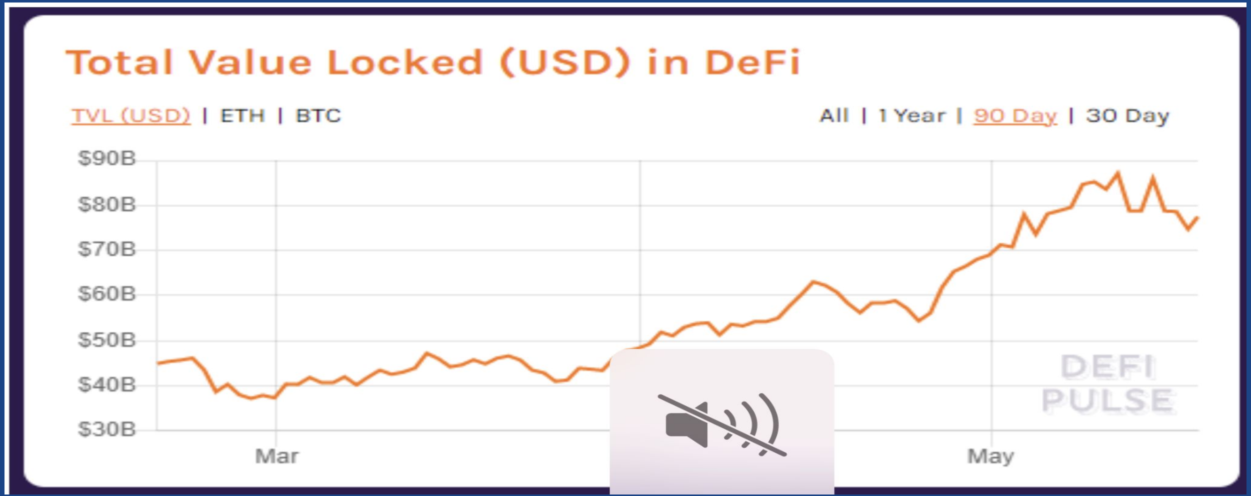
Total Addressable Market

Decentralized Finance (DeFi)

Nearly $100 Billion market cap

Yield Farming

$50 Billion in Protocol



Benefits for Farmers

- Yield Farmers can farm <u>any ecosystem assets on any chain</u> without using the bridges, and at the same APY

- Arable's goal is to be the most convenient place for farming and asset management

    Single-chain farming

    Zero slippage DEX for synths

    Easier asset management

Benefits for Minters

- Minters get the ACRE token as a reward for minting synths

- Get synths fees spent by users

Safe and Secure

ACRE Rewards

Synthetic Assets Rewards

Key Differentiation from Competitors

- Arable focuses on synthetic farms not only assets (unlike Synthetix and Mirror)

- Arable's main focus is not stock synths but synthetic crypto yield farms

Go-to-Market Strategy

- Airdropping ACRE tokens to users to get initial liquidity
- Securing initial ACRE liquidity from partnerships
- Working with Social Media Influencers in Crypto
